WHITEPAPER · THE PARITON PLATFORM

Custom software.
On a ready-made platform.

Pariton combines ready-made modules, AI and targeted custom development into business software that fits your company. For mid-sized businesses.

AI assistant · analysis with chart · Demo tenant · sample data

01

What Pariton is

Pariton is a platform for business software. Basics such as login, permissions, change log and AI are in place; ready-made modules cover sales, documents, e-mail and payments. We develop the part that makes your business special.

Three layers, one application

1

The foundation is in place.

Company login, permissions, AI and a complete audit trail. Every change stays traceable: who, when, what. This is the groundwork for processes that comply with GoBD, the German bookkeeping rules – built right into the core platform.

2

You choose the modules.

Business building blocks with integrations for marketplaces, ERP systems, banks and mailboxes. Activated and configured for your needs.

3

The difference is yours.

Your rules and specialised systems make the application your own. This is exactly where we invest the development time.

Who it is for

Mid-sized companies whose workflows standard software doesn't map well. From real projects in these industries:

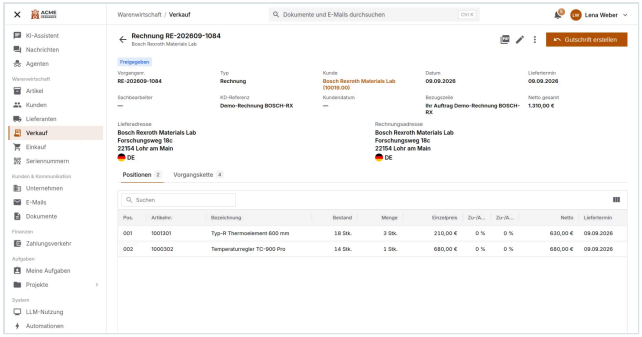

- **E-commerce & marketplaces** – Amazon, JTL and margins under control.
- **Manufacturing & wholesale** – Inventory and order management for products that need explaining.
- **Construction & tenders** – Find the right tenders and decide faster.
- **Consulting & funding** – Analyse evidence and documents with AI.

What you get

- **Grows with you.** From an automation alongside your ERP to full inventory and order management. On the same foundation.
- **Step by step, not big bang.** Start with what matters most today. Further stages follow when you're ready.
- **Your first workflow in days.** Ready-made modules and AI-assisted development shorten the path to the first usable solution. Scope, integrations and data determine the timeline.
- **Alongside your systems.** Connect your ERP, accounting and mailboxes. You decide which tasks Pariton takes over.

Modules

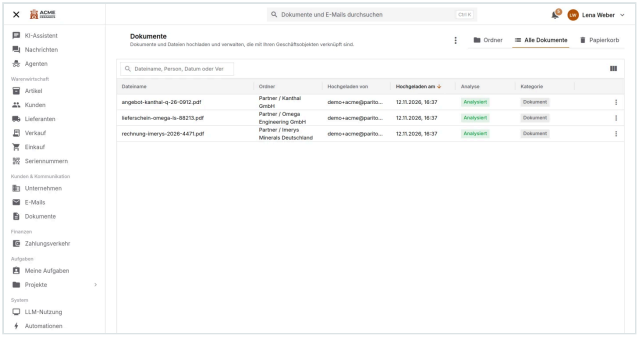

Ready-made business modules, activated and set up for your needs. Four of them at a glance:

Sales & e-invoicing

Document chain from quote to invoice, e-invoices in ZUGFeRD and Factur-X format and archived documents.

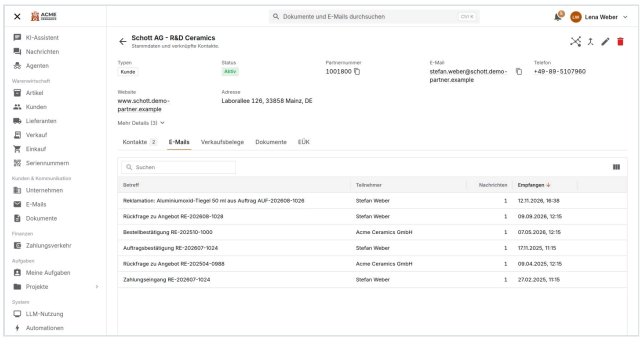

- Quote → order → delivery note → invoice
- E-invoices according to EN 16931
- Analyses with the AI assistant

Documents & document AI

Central archive with folders and versions. The document AI extracts data, search finds documents by meaning too.

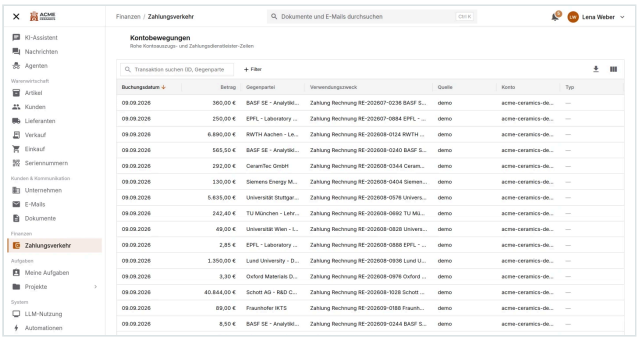

- Folders, versions, duplicate detection
- AI extraction of fields and tables
- Semantic search and summaries

E-mail & partners (CRM)

Connect mailboxes, keep companies and contacts up to date from e-mails and let AI prepare replies.

- Microsoft 365 and Google Workspace
- Contacts and companies from e-mails
- Reply drafts after approval

Banking & payments

Transactions from bank accounts, PayPal and Stripe in one place. An agent reconciles payments with open invoices.

- Bank transactions via PSD2 interface
- PayPal and Stripe in the same list
- Payment reconciliation with an AI agent

Also available: purchasing, products & stock, finance & margin and tenders. Included in every application: company login, roles & permissions, change log, views & dashboards, tasks & messages and notifications.

03

AI in the platform

In Pariton, AI is part of the platform: an assistant answers questions about your data, agents take over recurring work and automations handle routine tasks in the background.

AI assistant

Ask questions in plain language and get answers from your data: as text, table or chart.

Agents

Virtual team members for recurring tasks. They react to new e-mails or schedules and submit their results for approval.

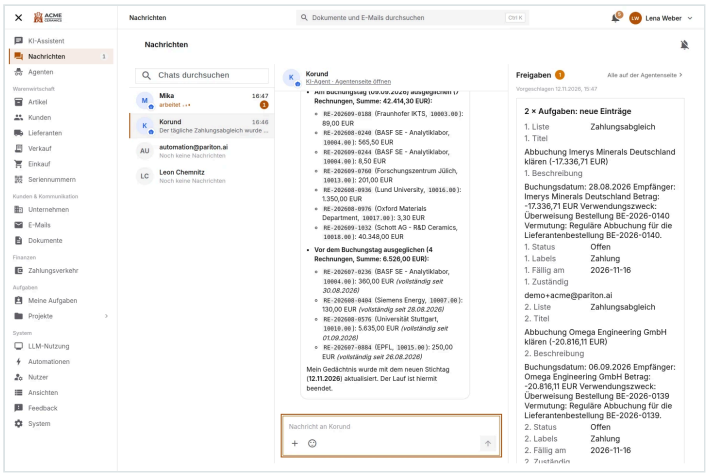

Automations

Fixed workflows without a click, such as creating companies and contacts from e-mails. Every run is logged.

AI never writes on its own.

The assistant and agents have no write permissions. Every change they propose waits for approval. This is enforced technically in the platform, not just agreed.

1. **Proposal** The AI prepares the change, for example a task or a reply draft.
2. **Review** You see exactly what would change.
3. **Decision** Approve, reject or ask for changes. The AI revises its proposal.
4. **Execution** The change runs on behalf of the approving person and is recorded in the change log.

Models in the EU

Language models such as Gemini, Claude and Mistral run via Google Cloud in EU regions.

No training on your data

Your data is not used to train AI models. The model providers commit to this as well.

Costs under control

The platform shows what AI was used for. Limits per company and person prevent surprises.

Recognisable as AI

Agents identify themselves as AI in external communication.

04

Security & data protection

Your company data is stored in a separate database in Frankfurt am Main. Roles control who may see and change what. Every change remains traceable, including those an AI proposed.

Hosting & data

- Data centre in Frankfurt am Main (Google Cloud)
- A separate database for every customer
- Daily backups with an additional copy in a second EU region
- Encryption in transit and at rest

Sign-in & access

- Company login via SSO with Microsoft or Google, or with e-mail and password
- Multi-factor authentication on request
- Roles and permissions: every role sees only what it needs
- Permissions apply directly in the database, including for AI queries

Traceability

- Change log: who, when, what
- AI proposals and their approval are logged
- Every automation run is recorded in the log

AI & data protection

- The assistant and agents change data only after approval
- Your data is not used for training
- Language models in EU regions
- AI traces in our own EU infrastructure, deleted after 30 days

Operations & checks

- Automated code analysis on every change
- Weekly updates of software dependencies
- Two-factor sign-in for all administrative access
- Monitoring in our own infrastructure in the EU

Contracts & operating models

- Data processing agreement (AVV) with technical and organisational measures
- Public list of sub-processors
- Operated as a managed cloud or in your own environment

What we state openly: We process your data in the EU. We name two exceptions explicitly: our sign-in service Stytch processes login data in the USA, and queries of the optional web search go to Linkup. Details are in the list of sub-processors.

Documents: data processing agreement (AVV), list of sub-processors and privacy notices at pariton.ai (in German).

05

Working together & costs

1

Process check

Together, we look at your work, your existing systems and the first use case that makes sense.

2

First stage

Implement your first clearly defined workflows within a few days. Configure modules, connect systems and test together. We expand larger projects step by step.

3

Expansion

Further modules and custom features are added when you're ready.

Feedback straight from the application

Report bugs and wishes in the feedback area or in the chat with the AI assistant. The report goes straight to our development team, and everyone in the company sees its status until it is implemented. We keep developing the platform, and all customers benefit.

How costs are made up

Costs depend on your needs and consist of three parts:

- **Setup:** one-time, for setup, data migration and the development of your custom workflows, in stages if needed.
- **Platform fee:** monthly, depending on activated modules, number of users, operating model and scope of support.
- **Usage:** for AI features and document analysis, by consumption. An overview in the platform shows usage, limits cap it.

Minimum term 12 months. You receive a concrete offer after the process check.

Your next step

Book a 30-minute demo. We look at your workflows and show you the platform with sample data.
